Reference Manual

Edition 1.0

April 1996

Notice

The ScanPlus products described in this manual comply with CE directives for electromagnetic emission levels and electrical immunity.

The information contained in this manual is for informational purposes only and is subject to change without notice. No part of this manual may be copied or reproduced in any manner without the prior written permission of United Barcode Industries.

ScanPlus products are covered by patents issued or pending in the USA and other countries. ScanPlus is a trademark of United Barcode Industries.

> This Reference Manual can be used with all ScanPlus products except the ScanPlus CL.

Contents

The topics in this manual are presented in alphabetical order for easy access. Use the *Contents* for a quick overview if you do not know where to find a particular item.

Beeps / green indicator LED

Power-up beeps / power-up LED

Two beeps indicate that the power-up sequence has been completed.

Three long beeps followed by five short beeps indicate an EEPROM integrity error at power-up. If this occurs, contact your UBI representative.

If you have an energy saver pushbutton model and the pushbutton is activated, the power-up beeps and power-up LED are deactivated and can not be activated.

Power-Up Beeps / Power-Up LED On (*)

Power-Up Beeps / Power-Up LED Off

Identifying the interface

After the two power-up beeps, the number of green indicator LED flashes at power-up indicates the interface driver selected for your ScanPlus.

The Part Number (P/N) indicates the hardware interface setup for your ScanPlus model.

green LED indication	selected interface type	P/N identification
continuous LED	null interface	factory default setting (all models)
no LED	laser emulation	x - x x x x x 0 - x x - x x
1 flash	wand emulation	x - x x x x x 1 - x x - x x
2 flashes	RS-232 C	x - x x x x x 2 - x x - x x
3 flashes	IBM 46xx cash registers	x - x x x x x 3 - x x - x x
4 flashes	RS-232 TTL	x - x x x x x 4 - x x - x x
5 flashes	OCIA cash registers	x - x x x x x 5 - x x - x x
7 flashes	keyboard wedge	x - x x x x x 7 - x x - x x

Good read beeps / good read LED

> By default, a single short beep (80 ms) indicates that the barcode has been read successfully.
>
> If Beep After Transmission is selected, the same beep indicates that the bar code has been read and transmitted to the host system.

Crackles, beeps and LEDs—2D bar codes

2D crackle / LED flicker

Crackle On (*)

LED Flicker On

Crackle Off - LED Flicker Off

Reading Codablock bar codes—ScanPlus XP / ScanPlus PDF

irregular crackle

The ScanPlus XP / ScanPlus PDF is reading Codablock data—the more intensive the crackle, the better the reading performance. If LED Flicker On is selected, the green indicator LED will also flicker. The crackling and flickering continue all the time the ScanPlus is reading.

single clear success beep   beep

The ScanPlus XP / ScanPlus PDF has successfully read the code.

> If the ScanPlus is removed from the Codablock code for more than 10 seconds before you finish reading the code (before you hear a success beep), the data you have read so far will be lost and you will have to start again.

Beeps / green indicator LED

Reading PDF417 bar codes—ScanPlus PDF

irregular crackle

> The ScanPlus PDF is reading new PDF417 data—the more intensive the crackle, the better the reading performance. If LED Flicker On is selected, the green indicator LED will also flicker.

regular tick

> The ScanPlus PDF has already read the data you are scanning—you will hear this if you have to rescan the same area of code a second time or if you pause over the code during scanning.

regular continuous crackle

> The ScanPlus PDF has read all the data and is doing error-correction processing—you will hear this with codes with a high security level or if the code is of poor quality.

single clear success beep

> The ScanPlus PDF has successfully read the code.

If the ScanPlus is removed from the PDF417 code for more than 10 seconds before you finish reading the code (before you hear a success beep), the data you have read so far will be lost and you will have to start again.

Configuration beeps

> The ScanPlus has special beeps for the configuration bar codes provided in this manual.

success A short beep followed by a long beep indicates the selection has been accepted by the ScanPlus.

error Six short beeps indicate a setup error (incorrect configuration code) for the selected interface type:

- option not available,

- interface number not available,

- optional feature not implemented,

- commands not read in the correct order,

- other setup errors.

> Three long beeps indicate an EEPROM hardware error during configuration. If this occurs, contact your UBI representative.

Software/CPU version beeps and flashes

Recent ScanPlus models produce software version identification beeps and CPU version LED flashes (red reading LEDs) when you read the Software / CPU Versions code (➔ *Software/CPU version identification*).

Code mark

Default code marks

> Code Mark Transmitted enables transmission of current settings of code marks—barcode symbology identifying characters.
>
> Code marks are transmitted after the preamble if present and before the barcode data.
>
> 💣 **Code marks should only be activated for keyboard wedge and RS-232 interfaces.**

Code Mark Not Transmitted (*)

Code Mark Transmitted

Default code mark values

symbology	default code mark
Codablock A	*
Codablock F	*
Codabar	D
Code 39	*
Code 93	D
Code 128 / EAN 128	D

AIM symbology identifiers

> AIM symbology identifiers are optional 3-character code marks that have been standardized by the AIM Committee.
>
> AIM symbology identifiers are transmitted after the preamble if present and before the barcode data.
>
> **Selecting AIM Transmitted automatically activates AIM symbology identifier transmission for all symbologies.**
>
> 💣 **AIM symbology identifiers should only be activated for keyboard wedge and RS-232 interfaces.**

AIM Not Transmitted (*)

AIM Transmitted

Identifier syntax

AIM symbology identifiers consist of 3 characters which provide the following information:

- the character "] " indicates that the input source type is a bar code,

- a letter (A, B, C, . . .) identifies the symbology,

- a hexadecimal number identifies any special processing performed by the ScanPlus.

Example	If you select AIM Transmitted, a standard Code 39 code without check digit and containing the string CODE-39 will be transmitted as follows:
	]A0CODE-39

The table on the next page provides the list of symbology identifiers and processing options supported.

Code mark

AIM symbology identifiers / supported processing options

Not all the special processing options are supported.

Refer to the official AIM documentation on symbology identifiers for full information on the different processing options.

symbology	AIM symbology identifier	AIM processing options
Codablock A	O	6
Codablock F	O	4
Codabar	F	0, 2, 4
Code 39	A	0, 1, 2, 4
Code 93	G	0
Code 128 / EAN 128	C	0, 1
Interleaved 2 of 5	I	0, 1, 2
Matrix 2 of 5	X	0
Standard 2 of 5	S	0, 1, 2
PDF417	L	0
MSI Code	M	0, 1
Plessey Code	P	0
UPC/EAN, "standard" lengths (8, 13, 15 (add-on 2), 18 (add-on 5) characters)	E	0, 3, 4
UPC/EAN, other lengths (no check digit, . . .)	X	0

Compose interface number

Which interface number?

To know which interface number to enter, check the following points in the order shown:

1. Look to see if there is a suitable number in the *Predefined interface numbers* section for your interface.

2. Look to see if your configuration is described in the *ScanPlus Terminal List* (if available).

3. If you still do not know which number to enter, contact your UBI representative.

Entering an interface number usually only modifies data transmission parameter settings but in some special cases, other parameter settings (pushbutton activation, indicator LED / beep settings, symbologies, etc.) may be modified for specific interface configurations.

💣 **Do not enter an interface number that is not compatible with the interface-specific software and hardware configuration of your ScanPlus model—check the ScanPlus Part Number if you do not know the interface for your model (➔ *Interfaces*).**

Composing an interface number

Example   To enter the number 102:

1. Scan Compose Interface Number on the next page.

2. Scan each digit of your interface number using the number codes—in our example we would scan 1, then 0, then 2.

3. Scan End Selection to finish.

Compose interface number

Concatenating configuration bar codes

What is a configuration bar code?

All the configuration codes in this Reference Manual are Code 128 bar codes with a special terminator character—FNC3, data string \60—to indicate that the code is a configuration code.

Why concatenate?

In order to configure the ScanPlus for a given installation, you may need to read a number of configuration codes one after the other—and you may need to do this for each ScanPlus you have to install and set up.

Many of the configuration bar codes in this manual can be concatenated (combined) to form a single custom bar code which corresponds to your own particular setup configuration—you then only need to read 1 or 2 concatenated codes instead of a whole series of codes.

Limitations

Do not create concatenated codes wider than the maximum reading width of your ScanPlus product (71 mm (2.80") for the ScanPlus SP for example).

If you need to create more than one code for a series of configuration codes, always end each concatenated code with a complete configuration code—not a partial code—and the FNC3 terminator.

You can not concatenate configuration codes that use the *Number codes* to compose numerical values.

How to concatenate

1. Identify the list of codes you want to concatenate and the order of concatenation—the codes should be concatenated in the same order as you would read them individually.

Example	If you need to enter Reset Factory Defaults, put this code at the beginning.

Concatenating configuration bar codes

2. Obtain the data strings for the codes you want to concatenate (➔ *Parameter list / data strings*).

Example	For the following codes, you will obtain the following strings:	
	reset factory defaults	\46\42\60
	N° 201 AZERTY - French	\41\4A\03\09\60
	Codabar active	\41\52\60
	2 good read beeps	\45\4A\01\60

You can also obtain the data strings by putting the ScanPlus into Display Data String mode and reading the configuration codes of your choice (➔ *Configuration modes—Display data strings*). However, the strings displayed include a check digit after the \60 end-of-code character which you must also remove when you concatenate the codes.

3. Use the individual data strings to create a single data string and remove the \60 end-of-code characters for each code except the last code in the string.

Example	For the codes listed in the previous example, you will obtain the following concatenated string:
	\46\42\41\4A\03\09\41\52\45\4A\01\60

4. If necessary, convert the hexadecimal values and backslash separators into suitable values for your barcode printing sofware (ASCII values for example).

The data strings contain hexadecimal values separated by backslashes.

Make sure that the values you use with your software correspond to these values.

Example: Instead of the hexadecimal value \41, you may need to use the equivalent ASCII character "A" (do not use the decimal value 41 !).

Configuration modes

Configuration authorization modes

Configuration enable mode

Configuration Enable Mode allows you to configure your ScanPlus at all times.

Configuration Enable Mode (*)

Configuration inhibit after 1 mn

Configuration Inhibit After 1 mn protects the ScanPlus from unintentional configuration actions—configuration is inhibited if no configuration codes are read during the first minute after power-up.
Each time a configuration code is read within 1 minute, configuration is enabled for another minute.
Configuration Inhibit After 1 mn is not available with ScanPlus pushbutton models.

Configuration Inhibit After 1 mn

ScanPlus startup   configuration code   1 mn   configuration code   1 mn   configuration inhibit   1 mn

Configuration modes

Temporary configuration mode

Temporary Configuration Mode allows you to test new configuration settings without loosing your current configuration setup.

Temporary configuration mode remains active until you select Restore/Update Current Configuration or until you switch off the ScanPlus.

Temporary Configuration Mode

Restore current configuration

Restore Current Configuration quits temporary configuration mode and returns the ScanPlus to its current configuration settings.

Restore Current Configuration

Update current configuration

Update Current Configuration replaces the current configuration settings with the new settings entered in temporary configuration mode.

The ScanPlus quits temporary configuration mode.

Update Current Configuration

Transparent configuration mode

Transparent Configuration Mode allows you to use the ScanPlus (and the present Reference Manual if required!) to configure other UBI products.

Transparent configuration mode remains active until you switch off the ScanPlus.

Transparent Configuration Mode

Example	To use your ScanPlus to configure UBI's OmniImage product:
	1. Connect the ScanPlus to the OmniImage in wand emulation mode (Wand/Magstripe connector of the OmniImage).
	2. Scan Transparent Configuration Mode.
	3. Use your ScanPlus to scan the desired configuration codes for interpretation by the OmniImage.
	4. Switch off the ScanPlus to deactivate Transparent Configuration Mode.

Configuration modes

Display data string mode

Display Data String Mode allows you to display the data string values and checksum for configuration bar codes on a terminal screen. The configuration codes in this manual are in Code 128 format.

Data string values are displayed in hexadecimal and are separated by backslashes.

Data string values are useful if you want to concatenate configuration bar codes (➔ *Concatenating configuration bar codes*) or if you want to send commands directly from the host terminal to the ScanPlus in RS-232 Slave Mode (➔ *RS-232—Slave mode*).

Display Data String Mode remains active until you switch off the ScanPlus.

Display Data String Mode

Example	1.	Scan Display Data String Mode.
	2.	Read a configuration bar code—the Code 39 activation code (➔ *Symbologies—Code 39*) for example.

The following data string will be displayed on your terminal screen:

\41\4C\60\5E

In this example, "\41\4C\60" is the command for Code 39 activation and "\5E" is the checksum.

Data decoding security parameters

Description

Data decoding security parameters allow you to ensure that the ScanPlus transmits the correct data after decoding, whatever the reading conditions or quality of the bar codes read.

Predefined security levels

The Normal Security Level optimizes the reading speed for most situations.

Only select Medium and High Security Levels when using poor-quality bar codes or for critical applications.

The predefined security level parameters can be modified individually.

Increasing the level of security reduces the reading speed.

Data security and barcode length

The reliability of the barcode data transmitted can depend on the symbologies used—some symbologies are more "fragile" than others and errors may occur due to incorrect interpretation of code lengths.

You can configure the ScanPlus to transmit data for codes of 1 or 2 fixed lengths only or codes with a known minimum length (➔ *Symbologies - Barcode length and data security*).

If you use the Compose Minimum Length option, we recommend that you use a check digit and the *Consecutive same read data validation* feature provided below to ensure that the same read result is obtained on 2 or more successive reads before the read is validated.

Data decoding security parameters

Predefined security levels

Normal security level

Single Read Before Transmission—300 ms Between Identical Consecutive Codes—No Time-Out Between Different Consecutive Codes

Normal Security Level (*)

Medium security level

2 Consecutive Same Reads Before Transmission—300 ms Between Identical Consecutive Codes—10 ms Between Different Consecutive Codes

Medium Security Level

High security level

4 Consecutive Same Reads Before Transmission—350 ms Between Identical Consecutive Codes—30 ms Between Different Consecutive Codes

High Security Level

Consecutive same read data validation

By default, transmission occurs after a single successful read.

Single Read Before Transmission (*)

Compose number of consecutive same reads before transmission

To increase the reliability of the data transmitted, you can set the ScanPlus to validate the data before transmission—it will only transmit data after a specified number of successful consecutive reads have given the same result.

Consecutive same read data validation is useful when increased data security is required—poorly printed codes, codes with variable lengths and without check digits, "fragile" barcode types.

Increasing the number of consecutive same reads before transmission decreases the decoding rate.

Compose Number of Consecutive Same Reads
Before Transmission (maximum = 10)

Example	To make your ScanPlus read the same code successfully 5 times before it can transmit it:
	1. Scan Compose Number of Consecutive Same Reads.
	2. Scan 5 then scan End Selection (➔ *Number codes* or inside back cover of this manual).

Data decoding security parameters

Time-out between identical consecutive codes

By default, you can only read identical consecutive codes after a time-out between reads of 300 ms.

300 ms Between Identical Consecutive Codes (*)

Compose timeout between identical consecutive codes

Increasing the timeout before you can read another identical code protects against unwanted reading of the same bar code.

This time-out should not be shorter than the Timeout Between Different Consecutive Codes.

Compose Timeout Between Identical Consecutive Codes
(maximum time-out = 2550 ms)

Example   To make your ScanPlus wait 1 second (= 1000 ms) before it can read the same code again:

1. Scan Compose Timeout Between Identical Consecutive Codes.

2. Scan   1   0   0   0   then scan End Selection (➔ *Number codes* or inside back cover of this manual).

Time-out between different consecutive codes

By default, you can read two different codes immediately one after the other—there is no time-out between reads.

No Time-Out Between Different Consecutive Codes (*)

Compose timeout between different consecutive codes

Increasing the timeout before you can read a different code protects against unwanted reading of other bar codes if they are close together on the same label.

This time-out should not be longer than the Timeout Between Identical Consecutive Codes.

Compose Timeout Between Different Consecutive Codes
(maximum time-out = 2550 ms)

Example	To make your ScanPlus wait 1 second (= 1000 ms) before it can read a different code:
	1. Scan Compose Timeout Between Different Consecutive Codes.
	2. Scan 1 0 0 0 then scan End Selection (➔ *Number codes* or inside back cover of this manual).

Default parameter settings

Use the Reset Factory Defaults code to reset all the ScanPlus parameters to their factory default settings (➔ *Reset all configuration parameters*).

➔ *Parameter list / data strings* provides the full list of parameters including default settings.

Emulating special keyboard keys— Keyboard wedge

Interpreting and transmitting special keyboard keys

> Different symbologies support different character formats. The ScanPlus transmission format is different according to the symbologies used (➜ *Symbologies - Character formats and ScanPlus transmission format*).

Only symbologies supporting the full ASCII character set allow the encoding of certain special keyboard keys such as <Return> and <Tab>.

No symbologies support the encoding of other function keys such as <PF1> and <PageDown>.

The *Special keys interpretation* codes provided below allow you to interpret different Code 39 character combinations as special keyboard keys.

The *Special keys transmission* codes allow you to transmit certain special keyboard keys directly as a single keyboard character instead of a <Ctrl> *character* combination.

Example

code read	interpreted as	transmitted as
(Code 39 code) x x x x x . L x x x	x x x x x . L x x x	x x x x x . L x x x
	Special keys interpretation x x x x x <Backspace> x x x	*Special keys transmission* x x x x x <Ctrl> H x x x
(full ASCII symbology code) x x x x x <Backspace> x x x	x x x x x <Backspace> x x x	or x x x x x <Backspace> x x x

Emulating special keyboard keys—Keyboard wedge

Special keys interpretation codes

The following codes allow the emulation of special keyboard keys by reading Code 39 bar codes containing dual-character combinations as shown in the *Code 39 keyboard emulation chart* on the next page.

As the dual-character combinations use Code 39 bar codes, the ScanPlus must be enabled to read Code 39 codes with the appropriate barcode length setting (➔ *Symbologies—Code 39*).

1 - Not Active (*)

2 - Always Active

3 - Only Active If Separate 2-Character Label
Or If Preceded By A Hyphen (-)

4 - Only Active If
Separate 2-Character Label

Example	original Code 39 bar code with . L dual characters (<Backspace>)	interpreted and transmitted as:
	code39.L12	1 - not activeCODE39.L12 **2 - always activeCODE312** 3 - separate 2 characters or hyphenCODE39.L12 4 - separate 2 charsCODE39.L12
	code39-.L12	1 - not activeCODE39-.L12 **2 - always activeCODE3912** **3 - separate 2 chars or hyphenCODE312** 4 - separate 2 charsCODE39-.L12
	--.L	1 - not active--.L **2 - always active-** **3 - separate 2 chars or hyphen** 4 - separate 2 chars--.L
	.L	1 - not active.L **2 - always activ** **3 - separate 2 chars or hyphe** **4 - separate 2 char**

Emulating special keyboard keys—Keyboard wedge

CTRL	.W	PF23	0W
SPECIAL	.X	PF24	0X

Emulating special keyboard keys—Keyboard wedge

Special keys transmission codes

Control characters transmission

Control Characters On transmits ASCII characters for decimal numbers 1 to 27 with the sequence <Ctrl> *character*.

Control Characters Off transmits the following characters directly as single keyboard characters—useful for applications that already use the control sequences as co mmands:

- ASCII character 8 transmitted as <Backspace> instead of <Ctrl> H
- ASCII character 9 transmitted as <Tab> instead of <Ctrl> I
- ASCII character 27 transmitted as <Escape> instead of <Ctrl> [

Control Characters On (*)

Control Characters Off

Example	xxx <Tab> xx (Code 128) is transmitted as:	
	xxx <Ctrl> I xx	(Control Characters On)
	xxx <Tab> xx	(Control Characters Off)

Alt mode transmission

Alt Mode On emulates the [<Alt>+*decimal_number_sequence*] function available on PC AT keyboards and can be used to transmit ASCII characters that are not available on the keyboard corresponding to your interface number.

If you read bar codes containing such characters, you will be able to transmit the characters if you select Alt Mode On. Only use Alt mode if necessary, as all characters will be transmitted as <Alt> sequences and transmission will be slightly slower.

Alt Mode Off (*)

Alt Mode On

Flashing mode

To increase LED life, the ScanPlus is configured by default to flash after 10 minutes in standby instead of producing a continuous beam. When you present a bar code, it will return to a continuous beam.

Flashing mode is the default mode for all ScanPlus models but is not available when the pushbutton of pushbutton models is activated.

Flash After 10 Minutes (*)

No Flash

Compose flash time-out

Compose Time-Out Before Flash
(1-minute increments, max = 60 minutes)

Example	To make your ScanPlus start to flash after 30 minutes of inactivity:
	1. Scan Compose Time-Out Before Flash.
	2. Scan 3 0 then scan End Selection (➜ *Number codes* or inside back cover of this manual).

Glossary

aiming beam	red light used to ensure that ScanPlus pushbutton models are correctly positioned over the bar codes before reading is activated—particularly useful for distance readers like the ScanPlus ER
CMM	Cable Management Module—cable adapter used to connect the ScanPlus to the host system if a direct connection is not possible (need for an external power supply, keyboard wedge configuration, ...)
data transmission parameters	interface-specific communication parameters—in certain cases they need to be modified to optimize the performance of the ScanPlus
dual-output RS-232 CMM	CMM for ScanPlus connected between two systems communicating through an RS-232 link (external power supply necessary)
external power supply	5V or 12V mains power supply adapter—necessary if the host system does not provide enough electrical power to drive the ScanPlus
interface number	automatically configures your ScanPlus by setting interface-specific parameters—in particular data transmission parameters—to suit your operating environment
keyboard wedge	ScanPlus connected between a keyboard and the host system—data from the ScanPlus is transmitted in keyboard emulation mode to provide instant software compatibility (an external power supply may be necessary)
operating parameters	parameters that affect the way the different ScanPlus models operate—general operating parameters include pushbutton activation, beep and indicator LED settings, operating mode settings, etc.
single-output RS-232 CMM	CMM for RS-232 configuration with external power supply
symbology	bar code type or "family"—Code 39, UPC and EAN are examples of common symbologies

IBM 46xx cash registers

Connection

port 5x or 9x

Predefined interface numbers

If your interface number is not among the predefined interface numbers, you must compose the number yourself (➔ *Compose interface number*).

N° 110   IBM 46xx cash registers—Port 9x

N° 111   IBM 46xx cash registers—Port 5x

Predefined data transmission settings

Predefined settings for IBM 46xx cash registers - Interface N° 110 / N° 111

The main predefined parameter settings for IBM 46xx cash registers depend on cash register protocols and can not be modified.

Transmission delay

➔ *Inter-message delay*

Installation procedure

The *ScanPlus Installation Guide* tells you step by step how to install and set up your ScanPlus to operate successfully in most working situations.

General installation / configuration procedure

1. Check you have everything you need (➜ *Product checklist*).

2. Switch off the host system and connect up your ScanPlus (➜ *Connection* for your interface).

3. Switch on the host system.

4. Scan the interface number for your system (➜ *Predefined interface numbers* for your interface or *Compose interface number*).

5. Customize the data transmission settings for your interface if required (➜ *Data transmission parameters* for your interface).

6. Select the symbologies you need and customize the symbology parameter settings if required (➜ *Symbologies*).

7. Customize the ScanPlus operating settings if required (➜ *Parameter list / data strings* and individual operating parameter entries).

Inter-character delay

The maximum rate at which data can be transmitted by the ScanPlus is affected by the response of the system. By the insertion of an inter-character delay, the ScanPlus can avoid dropping characters if it is transmitting decoded data too rapidly.

This feature can only be used with keyboard wedge and RS-232 interfaces and OCIA cash registers.

Predefined delay values

No Delay (*)

Interfaces

Interface types

> If you reset your ScanPlus to its factory default settings (➔ *Reset all configuration parameters*), no interface type is selected (null interface). In this case, you will have to re-enter the appropriate interface number for your system (➔ *Compose interface number*).

➔ *IBM 46xx cash registers*

➔ *Laser emulation*

➔ *Keyboard wedge*

➔ *OCIA cash registers*

➔ *RS-232*

➔ *Wand emulation*

Identifying the interface

> The Part Number (P/N) indicates the hardware interface setup for your ScanPlus model.
>
> The number of green indicator LED flashes at power-up indicates the interface driver selected for your ScanPlus. If you have an energy saver pushbutton model and the pushbutton is activated, you will have to press the pushbutton to see the power-up flashes.

P/N identification	selected interface type	green LED indication
factory default setting (all models)	null interface	continuous LED
x - x x x x x 0 - x x - x x	laser emulation	no LED
x - x x x x x 1 - x x - x x	wand emulation	1 flash
x - x x x x x 2 - x x - x x	RS-232 C	2 flashes
x - x x x x x 3 - x x - x x	IBM 46xx cash registers	3 flashes
x - x x x x x 4 - x x - x x	RS-232 TTL	4 flashes
x - x x x x x 5 - x x - x x	OCIA cash registers	5 flashes
x - x x x x x 7 - x x - x x	keyboard wedge	7 flashes

Predefined data transmission settings

Predefined settings for keyboard wedge - Interface N° 200

end-of-transmission keyboard character status	-	lower case
end-of-message control code	-	enter
inter-character delay	-	none
inter-message delay	-	none

> In this section, the predefined parameter settings for standard keyboard wedge configurations are indicated by an asterisk (*).

Preamble / postamble

The ScanPlus can send preambles and postambles—control codes before and after each message—to emulate command keys on the keyboard and allow automatic data entry:

    <preamble>   *<barcode data>*   *<postamble>*

Maximum number of characters in each preamble and postamble:

    ScanPlus SP: maximum = 5 characters

    ScanPlus ER / XP / PDF: maximum = 10 characters.

Preambles can contain customizable barcode type code marks (➜ *Code mark*).

No preamble / postamble

No Preamble

No Postamble

Compose preamble / postamble

Compose Preamble

Compose Postamble

Example	To enter the STX character (ASCII character 02) as a preamble:
	1. Scan Compose Preamble.
	2. Scan one or more character codes you want to include in the preamble—in our example we would scan the ASCII STX character code (➜ *ASCII character codes* and *Keyboard wedge—Additional preamble / postamble characters*).
	3. Scan End Selection to finish.

Predefined interface numbers

If your interface number is not among the predefined interface numbers, you must compose the number yourself (➔ *Compose interface number*).

N° 132   Laser With Pushbutton

N° 134   Connection to MicroBar LS

Laser emulation

Predefined data transmission settings

Predefined settings for laser emulation - Interface N° 132

transmitted symbology type	-	original code
margin size	-	10 x narrow bar width
logical signal state during transmission	-	bar = 1, space = 0, margin = 0
logical signal state outside transmission	-	quiet zone = 1

In this section, the predefined parameter settings for Interface N° 132 (standard laser emulation configuration) are indicated by an asterisk (*).

Transmitted symbology type

In laser emulation, the ScanPlus can transmit data in the original barcode format or converted into Code 39 format, provided that the bar codes contain characters that exist in the Code 39 standard.

Transmission In Original Code (*)

Transmission In Code 39

Example	To transmit Code 128 bar codes in Code 128 format:
	• Scan Transmission In Original Code.
	To transmit Code 128 bar codes in Code 39 format:
	• Scan Transmission In Code 39.

Transmission delay

➔ *Inter-message delay*

Laser emulation

Margin size

Predefined margin size

The size of the default margin is 10 times the size of the narrow bar (50 µs).

10 x Narrow Bar Width [*]

Compose margin size

Compose Margin Size

Example	To set a margin size of 20 x the narrow bar width:
	1. Scan Compose Margin Size.
	2. Scan the desired value in narrow-bar increments—in our example we would scan 2 0 (➔ *Number codes* or inside back cover of this manual).
	3. Scan End Selection to finish.

Logical output signal state

quiet zone	margin

Signal state during transmission

Bar = 1, Space = 0, Margin = 0 (*)

Bar = 0, Space = 1, Margin = 1

Signal state outside transmission

Quiet Zone = 1 (*)

Quiet Zone = 0

Laser emulation

Examples of signal state combinations

quiet zone	margin

Quiet Zone = 1 (*), Bar = 1 (*)

Quiet Zone = 0, Bar = 1 (*)

Quiet Zone = 1 (*), Bar = 0

Quiet Zone = 0, Bar = 0

Number codes

Use these number codes to enter custom numerical values required by certain configuration codes. The same number codes are provided on the inside back cover of this manual.

Pushbutton models

By default, the pushbutton on ScanPlus pushbutton models is deactivated.
To activate the pushbutton, you must select the appropriate pushbutton activation code for your ScanPlus model (➜ *Pushbutton models—Activation*).

Standard pushbutton models

Standard pushbutton models are suitable for standard applications where energy consumption is not a critical parameter.

When the ScanPlus goes into standby after one of the time-out conditions has been satisfied, the reading light and read function are switched off. Full energy is restored when the next reading situation occurs.

Standard pushbutton models consume more energy than energy saver models but they have other advantages:

- faster wake-up time,

- keyboard-host communication ensured after ScanPlus time-out (necessary for wedge applications for example),

- no current peaks during reading.

Pushbutton models

Energy saver pushbutton models

Energy saver pushbutton models are specially designed for energy-critical applications—using the ScanPlus with laptop computers for example.

When the ScanPlus goes into standby after one of the time-out conditions has been satisfied, current consumption drops to zero until the next reading situation occurs.

Energy saver pushbutton models consume less energy than standard pushbutton models but they have a slightly longer wake-up delay and are not suitable for all applications.

Pushbutton models—Activation

Pushbutton deactivation

> **By default, the pushbutton on ScanPlus pushbutton models is deactivated.**

Pushbutton Not Active (*)

Pushbutton activation

> To activate the pushbutton, you must select a pushbutton operating scenario.
>
> The same three operating scenarios are available for all ScanPlus pushbutton models (standard or energy saver):
>
> - Active For Read Duration (2 s)—Repeat Read Duration After Good Read
>
> - Active For Read Duration (2 s)—Standby After Good Read
>
> - Active While Pushbutton Pressed—Standby After Good Read
>
> The ScanPlus does not flash in standby when the pushbutton is activated.

Pushbutton models—Activation
Pushbutton operating scenarios

Active For Read Duration (2 s)—Repeat Read Duration After Good Read

This configuration allows you to read a number of bar codes after a single press of the pushbutton.

Active For Read Duration (2 s)—Standby After Good Read

This configuration is useful to avoid double reading—when bar codes are close together for example.

Active While Pushbutton Pressed—Standby After Good Read

This configuration is useful for selective reading of single bar codes.

press pushbutton   good read

standby

Pushbutton models—Activation

Standard pushbutton models

Only supported by ScanPlus models with part numbers 0-xxxxxx-**2**x-xx.

💣 **Do not use these codes with ScanPlus models that do not have a pushbutton.**

Standard Pushbutton
Active For Read Duration (2 s)—Repeat Read Duration After Good Read

Standard Pushbutton
Active For Read Duration (2 s)—Standby After Good Read

Standard Pushbutton
Active While Pushbutton Pressed—Standby After Good Read

Standard pushbutton models—Aiming beam

Only supported by ScanPlus ER / XP / PDF models with part numbers 0-xxxxxx-**2**x-xx.

ScanPlus ER / XP / PDF standard pushbutton models can be configured to produce an aiming beam when in standby mode. The aiming beam is a red light used to position the ScanPlus correctly over the bar codes before reading is activated.

💣 **Do not use these codes with ScanPlus models that do not have a pushbutton.**

Standard Pushbutton—Aiming Beam
Active For Read Duration (2 s)—Repeat Read Duration After Good Read

Standard Pushbutton—Aiming Beam
Active For Read Duration (2 s)—Standby After Good Read

Standard Pushbutton—Aiming Beam
Active While Pushbutton Pressed—Standby After Good Read

Pushbutton models—Activation

Energy saver pushbutton models

Only supported by ScanPlus models with part numbers 0-xxxxxx-**1**x-xx.

Activating energy saver pushbutton models deactivates the power-up beeps and power-up LED—they can not be activated in Energy Saver mode.

💣 **Do not use these codes with ScanPlus models that do not have a pushbutton.**

Energy Saver
Active For Read Duration (2 s)—Repeat Read Duration After Good Read

Energy Saver
Active For Read Duration (2 s)—Standby After Good Read

Energy Saver
Active While Pushbutton Pressed—Standby After Good Read

Compose read duration

By default, the ScanPlus remains active (reading) for 2 seconds when the pushbutton is pressed.

Activating the pushbutton (standard or energy saver pushbutton models) resets the default read duration value (2 s). If you want to modify the read duration, you must select Compose Read Duration after you have activated the pushbutton.

Compose Read Duration
(default 2 s, maximum = 65 s)

Example	To make your ScanPlus remain active and read for 20 seconds after you have pressed the pushbutton:
	1. Scan Compose Read Duration.
	2. Scan 2 0 then scan End Selection (➔ *Number codes* or inside back cover of this manual).

Reset all configuration parameters

Reset factory defaults

Reset Factory Defaults resets all the ScanPlus parameters to their factory default settings:

- null interface (no interface driver selected—no transmission),
- default symbologies,
- default symbology settings,
- default ScanPlus operating settings (pushbutton deactivated, LED / beep settings, etc.).

➜ *Parameter list / data strings* provides the full list of parameters and default settings.

💣 **If you scan Reset Factory Defaults, you will have to re-enter the appropriate interface number for your system and any custom settings if applicable. It is often easier to reset individual parameters.**
Reset Factory Defaults

General reset procedure

1. Make a list of your custom ScanPlus parameter settings if applicable.

2. Scan Reset Factory Defaults.

3. Scan the interface number for your system (➜ *Predefined interface numbers* for your interface or *Compose interface number*).

4. Customize the data transmission settings for your interface if required (➜ *Data transmission parameters* for your interface).

5. Select the symbologies you need and customize the symbology parameter settings if required (➜ *Symbologies*).

6. Customize the ScanPlus operating settings if required (➜ *Parameter list / data strings*, *Pushbutton models—Activation*, etc.).

J1 female
(* J2 male)

power supply

* reverse gender dual-output RS-232 CMM

By default, dual-output RS-232 CMMs for the ScanPlus are configured for data transmission on the DTE connector (to host) only.
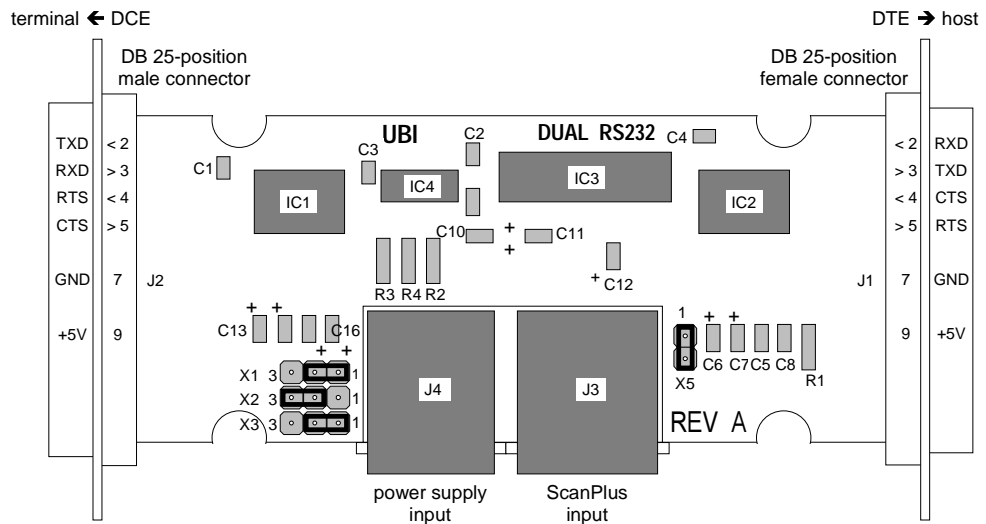

By modifying internal jumper settings, the dual-output RS-232 CMM can be set to transmit data on the DCE connector (to terminal) only or on both DTE and DCE (→ *Dual-output CMM—Jumper settings* below).

Dual-output CMM—Jumper settings

> To change the jumper settings, remove the four attachment screws and remove the cover of the CMM.
>
> Jumper settings are identical for standard and reverse gender dual-output RS-232 CMMs.
>
> **Make sure the** TO HOST **and** TO TERMINAL **labels are correctly positioned when you reassemble the CMM.**

Data transmission

transmit to host only (default)   transmit to terminal only   transmit to host and terminal

ScanPlus-host RTS/CTS handshaking

RTS/CTS handshaking on (default)   RTS/CTS handshaking off

RS-232

Predefined interface numbers

If your interface number is not among the predefined interface numbers, you must compose the number yourself (→ *Compose interface number*).

N° 100   Standard RS-232 C (9600, 7, E, 2)

N° 101   RS-232 TTL Level

N° 102   RS-232 PC Term

N° 103   RS-232 Compatible ScanPlus CL Slave Mode

N° 105   RS-232 Slave Mode

→ *RS-232—Slave mode*

Predefined data transmission settings

Predefined settings for RS-232 - Interface N° 100

baud rate	-	9600
data bits	-	7
parity	-	even
stop bits	-	2
ENQ (Hex 05)	-	not used
ACK (Hex 06)	-	not used
NAK (Hex 15)	-	not used
XON/XOFF (software)	-	inactive
CTS/RTS (hardware)	-	inactive
LRC (longitudinal redundancy check)	-	inactive
time-out (hardware and software)	-	1000 ms
end-of-message control code	-	carriage return + line feed
inter-character delay	-	none
inter-message delay	-	none

> In this section, the predefined parameter settings for interface N° 100 (Standard RS-232) are indicated by an asterisk (*).

RS-232

Baud Rate

9600 (*)

75

150

300

600

1200

RS-232

ENQ / ACK / NAK software protocol

(1) To use a different character for ENQ / ACK / NAK:

    1. Scan Compose Other Character.

    2. Scan the desired character code (➜ *ASCII character codes*).

    3. Scan End Selection.

ENQ enquiry character

Not Used (*)

ENQ (HEX 05)

Compose Other Character (1)

ACK acknowledge character

Not Used (*)

ACK (HEX 06)

Compose Other Character (1)

NAK negative acknowledge character

Not Used (*)

NAK (HEX 15)

Compose Other Character (1)

Typical ENQ / ACK / NAK scenarios

host terminal		ScanPlus
	ENQ	
	message (OK)	
	ACK (clears message)	

host terminal		ScanPlus
	ENQ	
	message (not OK)	
	NAK	
	repeats message (OK)	
	ACK (clears message)	

XON/XOFF software protocol

This protocol allows the host to control the flow of data from the ScanPlus.

To interrupt reception of data, the host transmits the XOFF character (ASCII DC3). To restart the flow, it sends the XON character (ASCII DC1).

Not Active (*)

Active

CTS/RTS hardware protocol

The ScanPlus acts as a standard terminal and manages the RTS/CTS lines when configured.

RTS is activated (high) before data is transmitted and deactivated (low) when message transmission is completed.

CTS is tested before transmission of each character. Data is only transmitted when CTS is activated (high). If CTS is not used by the host system, the ScanPlus maintains the level high.

Not Active (*)

Active

LRC (Longitudinal Redundancy Check)

LRC allows the exclusive OR of each character in the data. The result is converted into two bytes which can then be transmitted after the data.

Example   LRC = 4Ah -> LRC1 = 34h, LRC2 = 41h

Not Active (*)

Active

Time-out (hardware and software)

1000 ms (*)

Unlimited Time-Out (value = 0)

Compose time-out

Compose Time-Out
(minimum = 1 ms, maximum = 2500 ms)

Example   To set a hardware and software timeout of 2 seconds (= 2000 ms):

1. Scan Compose Time-Out.

2. Scan the desired value in milliseconds—in our example we would scan 2 0 0 0 (➜ *Number codes* or inside back cover of this manual).

3. Scan End Selection to finish.

RS-232

Preamble / postamble

The ScanPlus can send preambles and postambles—control codes before and after each message—to emulate command keys on the keyboard and allow automatic data entry:

<preamble>   <barcode data>   <postamble>

Maximum number of characters in each preamble and postamble:

ScanPlus SP: maximum = 5 characters

ScanPlus ER / XP / PDF: maximum = 10 characters.

Preambles can contain customizable barcode type code marks (➔ *Code mark*).

No preamble / postamble

No Preamble

No Postamble

Compose preamble / postamble

Compose Preamble

Compose Postamble

Example	To enter the STX character (ASCII character 02) as a preamble:

1. Scan Compose Preamble.

2. Scan one or more character codes you want to include in the preamble—in our example we would scan the ASCII STX character code (➔ *ASCII character codes* and *Keyboard wedge—Additional preamble / postamble characters*).

3. Scan End Selection to finish.

Predefined postamble codes

Carriage Return + Line Feed (*)

Carriage Return

Line Feed

Transmission delay

> ➔ *Inter-character delay*
>
> ➔ *Inter-message delay*

RS-232—Slave mode

Activation

Slave mode allows the ScanPlus to be configured or controlled directly by the terminal host via the RS-232 port.

N° 105 - RS-232 Slave Mode

How to use slave mode

1. Activate slave mode

Scan the N° 105 - RS-232 Slave Mode code and reconfigure the standard RS-232 parameters to suit your system if required.

2. Obtain the desired command strings

Put the ScanPlus into Display Data String Mode (➔ *Configuration modes - Display data string mode*) and read the codes you want the host to transmit. The full data string (command and checksum) of each code you read is displayed on the terminal screen.

Example	Reading the Code 39 activation code in Display Data String Mode will display the data string:
	\41\4C\60\5E
	In this example, "\41\4C\60" is the command and "\5E" is the checksum.

3. Adapt the strings to slave mode format

Remove the backslash separator characters from the data strings obtained in Display Data String Mode and adapt each string to slave mode format:

<startB> *<command>* *<checksum>* <stop>
(<**68**>)   (<**6A**>)

Example	To activate Code 39 from the host terminal in slave mode, you must send the following string from the host terminal:
	68414C605E**6A**

4. Send the commands from the host terminal to the ScanPlus

Transmit the commands from the host to the ScanPlus. You can send slave mode commands individually or make a list in a command file.

> **The values displayed in Display Data String Mode are hexadecimal values. Make sure that the values you send from the host system correspond to these values.**
>
> In our example, the ScanPlus must receive the hexadecimal value 41 or its equivalent (ASCII character "A", for example), not the decimal value 41.

5. Save the configuration and quit slave mode

Commands sent in slave mode are not saved automatically in the ScanPlus memory. If you wish to save the new configuration, enter the Update Current Configuration command (➔ *Configuration modes - Temporary configuration mode*)—manually or using slave mode.

To quit slave mode, rescan your normal interface number (➔ *RS-232 - Predefined interface numbers*) and reconfigure the RS-232 parameters to suit your system if required.

Scan rate parameters—ScanPlus SP

Increasing the scan rate decreases the ability to decode high-density bar codes. Try to find the best scan-rate/density ratio for fast successful reading of your bar codes.

Use the scan rate / decode rate ratio codes on the next page to optimize your reading applications.

💣 **These codes are only for use with the ScanPlus SP—do not use these codes with other ScanPlus models (ER, XP, PDF, ...).**

Predefined scan rates

90 scans/s (*)

115 scans/s

140 scans/s

230 scans/s

Scan rate / decode rate ratio

> 💣 **These codes are only for use with the ScanPlus SP—do not use these codes with other ScanPlus models (ER, XP, PDF, ...).**

Decode Rate = Scan Rate

Decode Rate = Scan Rate provides the best compromise between fast decoding and the maximum number of characters decoded at one time (maximum of 240 bars or spaces depending on the bar code format used):

- fastest decoding rate,

- limited number of elements in the barcode label (for example, Code 39 codes are limited to 23 characters maximum).

Decode Rate = Scan Rate (*)

||||||||||||||||||||||||

Decode Rate = Scan Rate / 2

Decode Rate = Scan Rate / 2 increases the ScanPlus buffer size to store more barcode data but decreases the decoding rate:

- unlimited barcode length,

- slower decoding rate.

Decode Rate = Scan Rate / 2

||||||||||||||||||||||||

Software / CPU version identification

Software / CPU Versions

Software and CPU version information is useful if you have a problem and need to contact your UBI representative (➔ *Troubleshooting*).

Software / CPU Versions

Version indications

For recent ScanPlus models, Software / CPU Versions identifies the versions of the software and CPU installed as follows:

- textual display on the host terminal screen (if applicable),

- a sequence of beeps indicates the software version,

- a sequence of red reading LED flashes indicates the CPU version.

Older ScanPlus models may not provide all of the above version information.

Textual display on the host terminal screen

If the ScanPlus is connected to a host terminal with a display monitor, the software and CPU versions are displayed on the screen.

Example	ScanPlus ER software version 3.7 and CPU version 1.5 is indicated by:
	ER 3.7 - CPU 1.50

Software / CPU version identification

Software version beeps

Each digit of the software version number (N.N) is indicated by a number of long beeps corresponding to (*version_number* + 1).

The specific software version letter if applicable (n.nL) is represented by a number of short beeps corresponding to the equivalent alphabetical position of the letter.

Example	Specific software version 4.0A is indicated by:
	5 long beeps a pause 1 long beep a pause 1 short beep

CPU version red LED flashes

Each digit of the main CPU version number (N.N) is indicated by a number of long beeps corresponding to (*version_number* + 1).

The specific CPU version number if applicable (n.nN) is represented by a number of short beeps corresponding exactly to (*specific_version_number*).

Example	Specific CPU version 1.63 is indicated by:
	2 long beeps a pause 7 long beeps a pause 3 short beeps

Symbologies

Available symbologies

Some symbologies such as Codablock and PDF417 are not available with all ScanPlus models—specific symbology availability is indicated with the symbology activation codes.

To optimize the performance of your ScanPlus and to ensure trouble-free scanning, do not select symbologies that you do not need (➔ *Symbologies—Activation*).

➔ *Symbologies—Codabar*

➔ *Symbologies—Codablock*

➔ *Symbologies—Code 39*

➔ *Symbologies—Code 93*

➔ *Symbologies—Code 128 / EAN 128*

➔ *Symbologies—Interleaved 2 of 5*

➔ *Symbologies—Matrix 2 of 5*

➔ *Symbologies—MSI Code*

➔ *Symbologies—PDF417*

➔ *Symbologies—Plessey Code*

➔ *Symbologies—Standard 2 of 5*

➔ *Symbologies—UPC/EAN code families (UPC-A, UPC-E, EAN-8, EAN-13)*

Default symbologies

Depending on your ScanPlus model, certain symbologies are already selected by default:

ScanPlus SP / ER / XP	-	UPC/EAN Code Set, Code 39
ScanPlus PDF	-	PDF417

Character formats and ScanPlus transmission format

symbology	character format supported	ScanPlus transmission format
• Code 39	alphanumeric—letter case not defined	upper case
• Code 93 • Code 128 • Codablock • PDF417	alphanumeric full ASCII—letter case defined	full ASCII—lower case/upper case as defined
• Codabar • Interleaved 2 of 5 • Matrix 2 of 5, • Standard 2 of 5 • UPC/EAN code set	numerical	numerical

Barcode length and data security

The reliability of the barcode data transmitted can depend on the symbologies used—some symbologies are more "fragile" than others and errors may occur due to incorrect interpretation of code lengths.

Depending on the symbology used, the following barcode length parameters allow you to configure the ScanPlus to only accept codes which meet certain length requirements:

- Compose 1 Or 2 Fixed Lengths—the safest option if you know that all the codes in your application have fixed lengths,

- Compose Minimum Length—if there are variable code lengths but you know that there is a minimum length,

- Any Length—the lowest level of security (use this option only if you can not use Compose 1 Or 2 Fixed Lengths or Compose Minimum Length).

Symbologies

As well as barcode length parameters, other configuration parameters help to increase the security of the data transmitted (➔ *Data decoding security parameters*).

If you use the Compose Minimum Length option, we recommend that you use a check digit (if available) and the *Consecutive same read data validation* feature (➔ *Data decoding security parameters*) to ensure that the same read result is obtained on 2 or more successive reads before the read is validated.

Not all the barcode length parameters are available for all symbologies.

💣 **Each symbology has a different set of configuration codes for barcode length parameters—you must only use the codes for your symbology.**

Compose 1 Fixed Length

Example	If the bar codes in your application have fixed lengths of 12 characters:
	1. Use your ScanPlus to read the Compose 1 Or 2 Fixed Lengths bar code for your symbology.
	2. Enter the fixed length—12 in our example—by reading the appropriate number codes (➔ *Number codes* or inside back cover of this manual).
	3. Scan End Selection.
	4. Scan End Selection a second time to finish.

Compose 2 Fixed Lengths

Example	If the bar codes in your application have fixed lengths of 8 and 12 characters:
	1. Use your ScanPlus to read the Compose 1 Or 2 Fixed Lengths bar code for your symbology.
	2. Enter the first fixed length—8 in our example—by reading the appropriate number code (➔ *Number codes* or inside back cover of this manual).
	3. Scan End Selection.
	4. Enter the second fixed length—in our example we would scan 1 then 2.
	5. Scan End Selection.
	6. Scan End Selection a second time to finish.

Compose Minimum Length

Example	If the bar codes in your application have a minimum length of 6 characters:
	1. Use your ScanPlus to read the Compose Minimum Length bar code for your symbology.
	2. Enter the minimum length—6 in our example—by reading the appropriate number code (➔ *Number codes* or inside back cover of this manual).
	3. Scan End Selection to finish.

Symbologies—Activation

To optimize the performance of your ScanPlus and to ensure trouble-free scanning, do not select symbologies that you do not need.

The Disable All Symbologies code deactivates all the symbologies activated. If you want to deactivate individual symbologies, use the Not Active codes for each symbology.

Disable All Symbologies does not reset the individual parameter settings for each symbology. When you reactivate a symbology, you recover the parameter settings stored in memory for that symbology when it was disabled.

If you want to reset all the individual symbology parameters to their factory default values, you must scan the Reset Factory Defaults bar code (➔ *Reset all configuration parameters*).

The symbology activation codes are also provided with the parameters for each symbology (➔ appropriate *Symbologies* section for your symbology).

Codablock

Select the desired Codablock format and scan Codablock—Active to enable.

Default values

|		
Start/stop bars	-	Not Transmitted
CLSI library system	-	Not Active
Check digit (AIM recommendation)	-	Not Used
Number of characters	-	Minimum Length = 6

Start/stop

Not Transmitted (*)

a, b, c, d

A, B, C, D
a, b, c, d   /   t, n, *, e

DC1, DC2, DC3, DC4

CLSI library system

Libraries in the CLSI system used in the United States require the insertion of spaces within the 14-character label—for example, the label 39990000192148 is transmitted as 3 9990 00019 2148.

The start/stop code can be transmitted or not transmitted as required.

Not Active (*)

Active

Check digit (AIM recommendation)

While Codabar has no check character, AIM has a recommended character. Each Codabar data character has a value assigned to it.

Not Used (*)

Checked And Transmitted

Checked But Not Transmitted

AIM data character values

data character	value	data character	value
0	0	-	10
1	1	$	11
2	2	:	12
3	3	/	13
4	4	,	14
5	5	+	15
6	6	A	16
7	7	B	17
8	8	C	18
9	9	D	19

Calculation of the check digit

1. The values corresponding to all the Codabar data characters in the message (including Start/Stop characters) are added together to make a total.

2. The data character which must be added to this total to make a multiple of 16 is the check character.

| Example	message:	A 0 1 2 3 4 B
	characters:	A 0 1 2 3 4 B
	values:	16 0 1 2 3 4 17
	sum of character values:	43
	next multiple of 16:	48
	48 - 43 =	5 (the check character)
	final message:	A 0 1 2 3 4 **5** B

Symbologies—Codabar

Barcode length

Barcode length (number of characters) for Codabar = [start + barcode data + check digit if applicable + stop]. The minimum length possible is 3 characters.

For maximum security, we recommend that you use one of the following parameters with all ScanPlus products:

- **Compose 1 or 2 Fixed Lengths (the safest configuration),**
- **Compose Minimum Length.**

💣 **The Any Length code provides zero security.**

Minimum Length = 6 (*)

Activation

Not Active (*)

Active

Default values

    Number of characters   -   Any Length

Barcode length

Barcode length (number of characters) for Code 93 = [barcode data]. The minimum length possible is 1 character.

If you know the minimum length of your bar codes, we recommend that you use the Compose Minimum Length parameter.

Any Length (*)

Minimum Length = 6

Compose Minimum Length

Compose minimum length using the special number codes (➔ *Number codes* or inside back cover of this manual) and scan End Selection:

minimum length: Compose Minimum Length
                                     <length>—End Selection

Symbologies—Code 128 / EAN 128

New normalization allows decoding of the UCC/EAN standard extension. EAN 128 is auto-discriminating with Code 128 (recognition of the FNC1 start character used).

Activation

Not Active (*)

Active

Default values

Number of characters	-	Any Length
FNC1 separator character for EAN-128 norms	-	GS function character (ASCII 29)

Barcode length

Barcode length (number of characters) for Code 128 / EAN 128 = [barcode data]. The minimum length possible is 1 character.

Any Length (*)

Minimum Length = 6

Compose Minimum Length

Compose minimum length using the special number codes (➔ *Number codes* or inside back cover of this manual) and scan End Selection:

minimum length: Compose Minimum Length
                                <length>—End Selection

Code EAN-128 norms (auto-discriminating)

Compose FNC1 separator character

> Inside the code, the FNC1 character can be used as a separator when multiple identifiers and their fields are concatenated. It is transmitted as the GS function character (ASCII 29) by default and can be substituted by your own ASCII character (used for example for keyboard wedge interfaces where the GS character can not be transmitted).

Compose Other Character
(default = GS, ASCII character 29)

Example	If you want to use SP (ASCII character 32) as FNC1 separator character:
	1. Use your ScanPlus to read the Compose Other Character bar code.
	2. Scan the desired ASCII character and scan End Selection (➔ *ASCII character codes*).

Symbologies—Interleaved 2 of 5

Activation

Not Active (*)

Active

Default values

Check digit	-	Not used
Number of characters	-	Minimum Length = 6

Symbologies—Interleaved 2 of 5

Check digit

The Interleaved 2 of 5 check digit can be used as the last encoded character of a label. This is especially recommended when using variable length Interleaved 2 of 5 and if the *Consecutive same read data validation* feature is not activated (➔ *Data decoding security parameters*).

Not Used (*)

Check digit mod 10

Checked And Transmitted

Checked But Not Transmitted

French CIP HR check digit

The CIP HR check digit is used in the French pharmaceutical industry. It is only used for codes with seven characters.

Checked And Transmitted

Checked But Not Transmitted

Barcode length

Barcode length (number of characters) for Interleaved 2 of 5 = [barcode data + check digit if applicable]. The minimum length possible is 2 characters.

Interleaved 2 of 5 always encodes an even number of characters. To handle codes with an odd number of characters, the ScanPlus will accept a code with the last character printed as 5 narrow bars. In this case, all useful characters are transmitted.

For maximum security, we strongly recommend that you use one of the following parameters with all ScanPlus products:

- **Compose 1 or 2 Fixed Lengths (the safest configuration),**

- **Compose Minimum Length.**

💣 **The Any Length code provides zero security.**

Minimum Length = 6 (*)

Any Length

Compose Minimum Length

Compose 1 or 2 Fixed Lengths

Compose different lengths using the special number codes (➔ *Number codes* or inside back cover of this manual) and scan End Selection once or twice as required:

Troubleshooting

> The tables in this section describe some common problems you may encounter when you use your ScanPlus (power-up, normal operation, configuration). Look for a description of your problem in the *symptoms* columns and try the proposed solution given in the *action* column.
>
> **If you can not solve the problem yourself, please contact your UBI representative.**

Before you contact your UBI representative . . .

If you do not find a solution in the following *Troubleshooting* tables, you can try a general reset of the ScanPlus.

1. Make a list of your custom ScanPlus parameter settings if applicable.

2. Switch off the electrical supply to the ScanPlus—switch off the host system or disconnect the ScanPlus.

3. Position the ScanPlus over the Reset Factory Defaults code (➜ *Reset all configuration parameters*) and provide electrical power—switch on the host system or reconnect the ScanPlus.

4. Finish the general reset procedure as described in *Reset all configuration parameters*.

> If you have a pushbutton model, press and hold the pushbutton when you perform step 3 and remember to activate the pushbutton after you have scanned Reset Factory Defaults.

If you still have a problem . . .

Contact your UBI representative and give full details of the problem.

Your UBI representative may ask you to provide the software / CPU version numbers for your ScanPlus. If the ScanPlus is powered up, try to read the Software / CPU Versions code to display this information on your host system screen if applicable (➜ *Software / CPU version identification*).

SP/XX/RM/10/E/960401

Power-up problems—all models

symptoms	possible causes	action (➔ *refer to*)
no power-up beeps / green power-up LED	• no electrical power or insufficient electrical power	check power supply
	• connection problems	check connections (*Connection diagram for your interface*)
	• incorrect product components (ScanPlus model, cables, external power supply as applicable)	check product part numbers, order form and invoice + *Connection diagram for your interface*, *Interfaces*
	• power-up beep / LED deactivated	activate power-up beep / LED (*Beeps / green indicator LED*)
	• energy saver pushbutton model	no action if pushbutton is activated—the power-up beeps and power-up LED are deactivated in Energy Saver mode and can not be activated (*Pushbutton models*)
power-up beeps but no green LED flash at power-up	laser emulation interface selected	no action if your interface is laser emulation (*Interfaces*)
green LED flashes a number of times at power-up	number of flashes indicate the selected interface type	• check the number of flashes for your interface (*Interfaces*) • reselect correct interface number for your system if necessary (*Predefined interface numbers* section for your interface, *Compose interface number*) and reconfigure
too many green LED flashes at power-up in spite of correct interface type selected	additional flash due to power surge at power-up	check that additional flash is at beginning and separate from other "normal" flashes (if applicable)
continuous green LED at power-up	null interface following Reset Factory Defaults	scan the predefined interface number code for your system (*Predefined interface numbers* section for your interface) or enter the correct interface number (*Compose interface number*) and reconfigure
error beeps from keyboard when connecting ScanPlus	host system already switched on	wait a few seconds—the beeps should stop
3 long beeps at power-up	EEPROM hardware error	contact your UBI representative
3 long beeps then 5 short beeps at power-up	EEPROM integrity error	contact your UBI representative

Troubleshooting

Operating problems—all models

symptoms	possible causes	action (→ *refer to*)
no beeps or green indicator LED during reading, no transmission	• installation problem	check ScanPlus power supply, connections (*Connection* diagram for your interface), product components
	• configuration problem	• check you have the correct product components (ScanPlus model, cables, CMM, external power supply as applicable) • check you have the correct number of flashes for your interface at power-up (*Interfaces*) • reselect correct interface number for your system if necessary (*Predefined interface numbers* section for your interface, *Compose interface number*) • if you have just configured the ScanPlus, make sure you have finished correctly—the ScanPlus may be waiting for an End Selection for example
	• symbology not selected	activate the required symbology (*Symbologies—Activation*)
	• symbology not supported by your ScanPlus model	see the user's leaflet (if available) for your ScanPlus model, read the appropriate test code (*Test codes*)
	• good read beep / LED deactivated	activate if required (*Beeps / green indicator LED*)
	• barcode length incompatible with ScanPlus configuration (minimum/fixed length parameter settings)	• check bar code • change barcode length setting for your symbology (*Symbologies*)
	• ScanPlus configured for check digit and no check digit present in code	• check bar code • change check digit configuration for your symbology if applicable (*Symbologies*)
	• you have read a pushbutton activation code with a non-pushbutton ScanPlus model	perform the global reset procedure provided at the beginning of this section (*Troubleshooting - Before you contact your UBI representative . . .*)

error beeps from keyboard or no manual keyboard response (keyboard wedge interface)	disconnect ScanPlus from CMM:	
	• if problem disappears, the problem is with the ScanPlus	check ScanPlus model and configuration
	• if problem remains . . .	check all product components (ScanPlus model, cables, CMM, power supply as applicable), installation and configuration
ScanPlus reads the same bar code more than once, transmits same data	insufficient time-out between identical consecutive codes	increase time-out between identical consecutive codes (*Data decoding security parameters*)
ScanPlus transmits different data for the same bar code	• ScanPlus interprets part of the label as a different code (different symbology)	scan Disable All Symbologies and only activate the symbologies you need (*Symbologies—Activation*)
	• ScanPlus interprets part of the label as a separate code (smaller code inside the label)	use the Compose 1 or 2 Fixed Lengths or Compose Minimum Length parameters if available (*Symbologies - Barcode length and data security* and *Barcode Length* section for your symbology)
	• insufficient number of data validation reads (code damaged or poorly printed)	increase number of consecutive same reads before transmission (*Data decoding security parameters*)

Operating problems—pushbutton models

| symptoms	possible causes	action (→ *refer to*)
ScanPlus does not operate	pushbutton not pressed	press the pushbutton!
pushbutton does not operate	• pushbutton not activated (default configuration)	activate the pushbutton for your ScanPlus model (*Pushbutton models—Activation*)
	• pushbutton activation problem	perform the global reset procedure provided at the beginning of this section (*Troubleshooting - Before you contact your UBI representative . . .*)
no red aiming beam (standard pushbutton models)	aiming beam not activated	activate the aiming beam (*Pushbutton models—Activation*)
ScanPlus does not flash with flashing mode activated	pushbutton activated	no action (flashing deactivated when pushbutton activated)

Troubleshooting

Configuration problems—all models

| symptoms	possible causes	action (➔ *refer to*)
6 short beeps when reading a configuration code	configuration error: • option not available • interface number not available • optional feature not implemented • commands not read in the correct order • other setup errors	check current action—make sure in particular that you have scanned End Selection once or twice if required for the previous parameter
no success beeps / green indicator LED when reading a configuration code	• installation problem	check ScanPlus power supply, connections (*Connection* diagram for your interface), product components
	• ScanPlus in Configuration Inhibit After 1 mn mode	scan Configuration Enable (*Configuration modes*)
code mark selection not taken into account	you forgot to scan End Selection after scanning the desired ASCII character	re-enter the desired code mark (*Code mark*) and scan End Selection (*ASCII character codes*)
3 long beeps then 5 short beeps during configuration	EEPROM integrity error	contact your UBI representative
3 long beeps during configuration	EEPROM hardware error	contact your UBI representative

Wand emulation

Predefined interface numbers

> If your interface number is not among the predefined interface numbers, you must compose the number yourself (➔ *Compose interface number*).

N° 130   Digital Wand Emulation

N° 131   Analog Wand Emulation

Predefined data transmission settings

Predefined settings for Wand emulation - Interface N° 130

transmission code type	-	original code
margin size	-	10 x narrow bar width
logical signal state during transmission	-	bar = 1, space = 0, margin = 0
logical signal state outside transmission	-	quiet zone = 0
pulse duration	-	0.88 ms (37.5 cm/s)

In this section, the predefined parameter settings for Interface N° 130 (standard wand emulation configuration) are indicated by an asterisk (*).

Wand emulation

Transmitted symbology type

In wand emulation, the ScanPlus can transmit data in the original barcode format or converted into Code 39 format, provided that the bar codes contain characters that exist in the Code 39 standard.

Transmission In Original Code (*)

Transmission In Code 39

| Example	To transmit Code 128 bar codes in Code 128 format:
	• Scan Transmission In Original Code.
	To transmit Code 128 bar codes in Code 39 format:
	• Scan Transmission In Code 39.

Transmission delay

➜ *Inter-message delay*

Margin size

Predefined margin size

The size of the default margin is 10 times the size of the narrow bar (50 µs).

10 x Narrow Bar Width (*)

Compose margin size

Compose Margin Size

Example	To set a margin size of 20 x the narrow bar width:
	1. Scan Compose Margin Size.
	2. Scan the desired value in narrow-bar increments—in our example we would scan 2 0 (➔ *Number codes* or inside back cover of this manual).
	3. Scan End Selection to finish.

Wand emulation

Logical output signal state

	quiet zone	margin

Signal state during transmission

Bar = 1, Space = 0, Margin = 0 (*)
Bar = 0, Space = 1, Margin = 1

**Signal state outside transmission**
Quiet Zone = 0 (*)

Quiet Zone = 1

Wand emulation

Examples of signal state combinations

quiet zone   margin

Quiet Zone = 0 (*), Bar = 1 (*)

Quiet Zone = 1, Bar = 1 (*)

Quiet Zone = 0 (*), Bar = 0

Quiet Zone = 1, Bar = 0
Wand emulation

Pulse duration

The values represent the pulse duration of a narrow bar or space.

Speeds (values in parentheses) are provided for standard UPC/EAN bar codes with 0.33 mm narrow-bar elements.

0.88 ms (37.5 cm/s) (*)

0.19 ms (175 cm/s)

0.26 ms (125 cm/s)

0.44 ms (75 cm/s)

0.66 ms (50 cm/s)

1.32 ms (25 cm/s)

2.64 ms (12.5 cm/s)

6.60 ms (5 cm/s)

Pulse duration speed calculation

Actual emulated speed = [100 x (r / t)] cm/s

with r = actual narrowest element (mm)

t = set-up duration element (ms)

Example	narrowest element (r):	0.45 mm
	set-up duration element (t):	0.4 ms
	emulated speed:	100 x (0.45 / 0.4) = 112.5 cm/s
